

### SolarGo2 Panel Mount Kit Z Bracket 4PCS -ALUMZ

**These brackets are recommended for use on installations where the bracket can be secured to solid/robust roof structure surface using the fixings supplied (8 self-tapping screws ST5.5x38) and protection against water ingress can be achieved (sealant around holes etc)**

It is worth taking time to decide on the position of the solar panel. Make sure you have enough room/space for the solar panel and fixing brackets, avoiding shade on the panel where possible.

Secure the four aluminium fitting brackets to the underside of the solar panel using the supplied, M6 stainless-steel hex head bolts, nuts, and washers (you will require two 10mm spanners). The brackets are attached to the longest side of the solar panel at either end. The solar panel has pre-drilled holes in the underside of the frame. Fig 1 shows the bracket placed on the solar panel frame.

Fig 1

Fig 2

The bolts, washers and nuts are assembled as in Fig 2 (bolt, washer, spring washer, and nut)

The bolt, washers and nut are shown assembled in Fig 3, tighten with 10mm spanners.

Fig 3

The solar panel can now be secured to the surface using the 8 x self-tapping screws (ST5.5x38). Seal around any penetration holes before and after securing.
